

LimRAD Auth Platform

HotSpot

Corporate Guest Network Authentication

Guest Network Authentication Tool (HOTSPOT):

During the network access of the guests coming to the institutions, it is necessary to protect the information sources of the institution and to register the guests according to the laws.

The HOTSPOT module verifies guest users' network access using the web interface in the following ways:

- Verification by ID Number
- Verification by SMS
- Verification by E-mail
- Sponsor approval

Each of these tools can be used separately or all of them can be used at once.

Creating multiple customizable pages such as providing guest service in corporate networks, creating city-wifi projects in municipalities, and making surveys and advertisements on the entrance screens is realized within the system.

If requested, surveys can be created by institutions, events can be organized, and these can be presented to the user during the guest registration process. The information provided by the respondents can be analyzed in a consolidated way.

System Features:

- Redundant Virtual Appliance architecture
- Multiple roles and service rule architecture
- Multiple hardware manufacturer support
- Creating custom rules for users, groups
- Advanced reporting feature
- Consolidated Log feature, forwarding log to external syslog servers
- Supported virtualization platforms: VMware vSphere Hypervisor (ESX /ESXi), Microsoft Hyper-V, CentOS KVM and Amazon AWS
